Population Prediction

February 5, 2022

Luis Garduno

Dataset: International Database (IDB)

Question Of Interest: Predict the population of earth in 2122.

1 Data Understanding

1.1 Data Description

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 34237 entries, 0 to 34236
Data columns (total 99 columns):

#	Column	Non-Null Count	Dtype
0	#YR	34237 non-null	int64
1	TFR	26163 non-null	float64
2	SRB	26163 non-null	float64
3	RNI	26172 non-null	float64

if 'POP' in df_pop:
    y = df_pop['POP'].values
    del df_pop['POP']
    X = df_pop.to_numpy()
```

2 Modeling

Derived the formula for calculating the optimal values of the regression weights:

$$w = (X^T X)^{-1} X^T y$$

where X is the matrix of values with a bias column of ones appended onto it. For the population dataset one could construct this X matrix by stacking a column of ones onto the $\mathtt{df_pop.YEAR}$ matrix.

$$X = \begin{bmatrix} \vdots & 1 \\ \dots & \text{ds.data} & \dots & \vdots \\ \vdots & 1 \end{bmatrix}$$

```
# Calculate optimal values of the regression weights
w = np.linalg.inv(X.T @ X) @ X.T @ y
print("\n++++++++++ WEIGHTS ++++++++++++++++\n", pd.DataFrame(data=w))
diff = np.round(( (y - (abs(np.dot(X,w) - y))) / y ) * 100, 2)
print("\n========\n", pd.
 →DataFrame(data=diff))
